Formal and Informal Models and Validation

Wilbert Wils

Radboud University Nijmegen, Netherlands

Experiences of a mathematical physicist in the real world. I am writing a book with the title: The mountains are right. It is inspired by a saying that I met in a Norwegian mountain hut on my walks there: if the mountains do not agree with the map, the mountains are right. Of course maps are a kind of model. The book is about how living beings work as servo-mechanisms: perceiving, evaluating, and on the basis of the results of that process, acting. The evaluation happens on the basis of internal "models".
